Packages

- [@ngrx/store](#) - RxJS-based store
- [@ngrx/effects](#) - Side effect management
- [@ngrx/router-store](#) - Bindings to connect the Angular Router to @ngrx/store
- [@ngrx/store-devtools](#) - Store instrumentation that enables a powerful time-travelling debugger.
- [@ngrx/entity](#) - Entity State adapter for managing record collections.
- [@ngrx/schematics](#) - Scaffolding library for Angular applications using NgRx.

Angular ngrx-data

code style prettier

Zero Ngrx Boilerplate

You may never write an action, reducer, selector, effect, or HTTP dataservice again.

NgRx helps Angular applications manage shared state in a "reactive" style, following the [redux](#) pattern. But to use it properly requires *both* a deep understanding of redux/ngrx *and* a lot of *boilerplate code*.

Ngrx-data is an *ngrx* extension that offers a gentle introduction to *ngrx/redux* without the boilerplate.

`@ngrx/entity`

Helps with Create, Read, Update, and Delete (CRUD) operations on entities

Helper function for managing collections of entities

Reduces the boilerplate required to manage entities

@ngrx/schematics

Schematics: scaffolding library for generating code using the CLI

- ng new
- ng generate

@ngrx/schematics: set of schematics for generating NgRx

- ng generate **store**
- ng generate **action**
- ng generate **reducer**
- ng generate **effect**
- ng generate **feature**
- ng generate **container**
- ng generate **entity**

@ngrx/router-store

**Connects the Angular router to the store
Dispatches router navigation actions**

ngrx-data

Abstracts away the NgRx entity code

Configuration and convention, not code

- No actions or action creators
- No reducers
- No selectors
- No effects
- No code generation

Extension points for customization
